[Malignant pustule of the vulva: a rare entity that may be difficult to diagnose]. A 64-year-old woman presented with a painless ulceration of the left lower abdomen and vulva. Based on the clinical, biological, and histopathological findings, the diagnosis of a benign basal cell carcinoma was retained.

However, the patient refused the operation. Six months later, the patient returned with a red, painful ulceration, almost totally covered by purulent secretion and located in the same zone as the previous ulceration. The histopathological examination revealed a malignant pustule, revealing the diagnosis of hidradenocarcinoma. The patient was treated with palliative therapy.

Racoon etc. 1. Field of the Invention
The present invention relates to a control device for an internal combustion engine, which is adapted to control the opening and closing of a throttle valve, the operation of an engine intake-air control valve, etc. with a single actuator, and more particularly to a control device for an engine which permits the operation of the entire engine including the control of the throttle valve to be performed rapidly and with good responsiveness. 2. Description of the Prior Art A so-called throttle-by-wire device is known which is adapted to open or close the throttle valve of an internal combustion engine, and in which a throttle-valve operating actuator is controlled with a single electric motor. In the throttle-by-wire device, an accelerator pedal position

is sensed by an accelerator pedal position sensor, for example, and a throttle valve opening degree is controlled through a throttle valve driving actuator controlled by an electric motor, which is in turn controlled in response to a signal from the accelerator pedal position sensor to open or close the throttle valve. The throttle valve is controlled with high response and with a high degree of accuracy. Accordingly, if an electronic control system and a control device based on the electronic control system are to be applied to the throttle-by-wire device, each of them would require sufficient responsiveness and high accuracy. Thus, the entire engine control device would be required to be designed in such a manner that the entire control device is capable of compensating for

any reduction in responsiveness or in accuracy. In order to avoid the above, it has been proposed to provide throttle-by-wire devices including a function of low-responsivity control, which are adapted to control throttle valve operating actuator and actuator so as to open or close the throttle valve at a rotational speed of, e.g., about 3,000 to 6,000
