Photoshop isn't meant for this, but you can keep a different folder for each project and use Photoshop to open and modify the correct file for each job. * It's okay to work on images in several stages. Just remember to modify files for each job. * Use the Photoimpression feature when working with a camera. It will re-create the format in which the camera has stored the image and apply the best possible settings for the image. This option is available from the Apply menu. * Create multiple versions of a photo at the same time. You can apply different edits to each version and then select the one you like best. Just be aware that Photoshop uses internal memory locations for any changes that aren't saved. So, if you start working on an image and need to exit to update some other feature, you may find that you've lost your work. You can export an image at any time for use elsewhere. The export dialog box opens from the File menu and enables you to save the image in the various formats available (see Figure 11-4). * Consider using Photoshop as a composition tool as much as an image editor. If you split the image to help

Q: In python, should variables be declared with 'from' and how can I ensure typing? I have started learning python after years of C++, and am accustomed to using inline type checking to ensure that variables are defined by the type of values they contain and the methods they have. In python, however, this doesn't seem to work. If I try the following in IDLE: def test(a, b): return a + b print test(10, 20) I get the following message: >>> print test(10, 20) Traceback (most recent call last): File "", line 1, in print test(10, 20) NameError: name 'test' is not defined This seems strange to me, since python's type system is quite strong; should I even be worrying about this? What am I doing wrong? A: In python, try this >>> test = test This is called "automagic", and it does depend on the kinds of values you store in variables. It's nice because you can't accidentally change variable type by accident, but it's also tedious in other ways - you have to do this every time you write a "normal" function that takes arguments. You might try the following: >>> def test(a, b): ... return a + b ... >>> test = test >>> test(10, 20) 30 And you'll see that it works. A: The python documentation says that the "automatic-import" feature is the opposite of the "type checking" feature, and it is Python's main feature for "less typing" and "easier to debug" during and after development. When you're programming it is nice that the language makes "things" for you. So you don't need to write type checks every time, but when you need to write a function that accepts and returns some types it's nice to have the types and parameter names there. The problem is that when you don't think about the "value of a function/variable" and then invoke that function/variable, the "automatic-import" doesn't "know" that you are trying to invoke a function that accepts and returns some types. The last few

Q: Java - for each loop with variables inside (a beginner problem) I'm trying to build a class which allows users to paste and draw shapes, then I'd like to pass each shape and its size to a "used area" (which stores the number and size of pasted shapes) and at the end of the program return how many shapes have been used. I've put a lot of code here and simplified the program as much as possible, but I'm having a problem with the for loop. I'm trying to add each shape to the array, but the code gets stuck at a point where the "shape1.getSize().length" is throwing a null pointer. Here's the code: public class Shape1 { int[] shape1; int[] shape2; int[] shape3; int size1; int size2; int size3; int used; public Shape1(int size1, int size2, int size3) { this.size1 = size1; this.size2 = size2; this.size3 = size3; shape1 = new int[size1]; shape2 = new int[size2]; shape3 = new int[size3]; } public void draw(Graphics g) { g.setColor(Color.cyan); for(int i = 0; i
