

when testing the battery and alternator for maximum amps output, a short discharge cycle is used. this is a single test of the battery and alternator. this test mimics the condition of the battery under extreme cold weather conditions. the battery should be fully charged, placed on a flat surface, and the engine disconnected. the test is performed at the time of the battery short test, and should be repeated several times. for example, the xs power s925 battery has a rated rc of 55 minutes. this means that with the s925 starting at a full charge at 27c, it can maintain a 25 amp load (similar to a large cooling fan) for 55 minutes before battery voltage drops to 10.5 volts. it is easy to see how this rating is very important in determining how well a battery will operate accessories in the event of a charging system failure, if the vehicle is not properly equipped with an alternator or if the vehicles engine is not running. for example, if the battery could maintain a 25 amp load for 55 minutes, the battery's capacity would be $55 \times 24 \times 60 \times 60 = 5.43\text{ah}$. however, if the battery could maintain the same load for only 45 minutes, its capacity would be $45 \times 24 \times 60 \times 60 = 2.79\text{ah}$. the xs power s925 battery has a rated rc of 55 minutes. this means that with the s925 starting at a full charge at 27c, it can maintain a 25 amp load for 55 minutes before battery voltage drops to 10.5 volts. it is easy to see how this rating is very important in determining how well a battery will operate accessories in the event of a charging system failure, if the vehicle is not properly equipped with an alternator or if the vehicles engine is not running.

Auto Xs Battery And Alternator Tester Instructions

to measure the battery capacity, the tester can be programmed to load and measure the battery until it has reached the desired capacity, and then automatically discharge the battery. this will provide a real-time battery capacity report. when a battery is being charged and discharged at the same time, it is possible that the battery will not be charged or discharged at the correct rate. to check this, the tester can be programmed to measure the voltage across the battery when it is charged and discharged at the same time. if there is a difference in voltage when the battery is being charged and discharged at the same time, it is possible that the battery has a fault and is not being charged or discharged at the correct rate. this can be determined by using the tester for 30 minutes, or until the battery reaches a specified capacity. the battery can be cycled at a specified rate, and the voltage across the battery can be measured. the tester can also be programmed to measure the amps across the battery when being cycled at a specified rate. the tester can then be programmed to load the battery at a specified load for a specified time, and the amps across the battery can be measured. this is a very useful test if the battery is being used in a vehicle. there are different tests that should be performed to test the maximum amp-hours output of the battery and alternator combination. using a multimeter, perform a short discharge cycle and check the battery voltage and then record the amperage. then perform a continuous discharge cycle and record the amps. 5ec8ef588b
